9.) CONCLUSION

The Airline reservation system has been a way of minimizing the clerical work, which is almost a routine and consumes the most precious time.

This AIRLINE RESERVATION SYSTEM has been an attempt to help the user to minimize his workload along with minimizing the paper works and saving of time.

Almost all the difficulties of manual reservation have been removed by this system. To wind up let me welcome all the suggestions and other improvements, which the system needs so that it covers all the needs if the user in the user way.

During our database management course we have learned about the basics of database design. This project gave us the opportunity to try our new skills in practice. While doing this project we also gained deeper understanding on database design and how it can be implemented in real life situations. We believe we can use our database designing skills also in other university projects.
